

#### Conservation Activity Plan (CAP)

## FOREST MANAGEMENT

A forest management conservation activity plan is a site-specific strategy to help a landowner manage forest lands while protecting wildlife habitat and soil, water, air, and plant quality.

NRCS Technical Service Providers (TSPs) prepare these plans using inputs such as:

- Analyses of past management activities
- Existing and planned forest resource conditions including soil, water, site index, stand quality and health, and stocking level.

Conservation practices recommended in such a plan can include:

- Forest stand improvement
- Tree/Shrub establishment
- Forest slash treatment
- Firebreaks
- Prescribed burning
- Riparian forest buffers
